

**EUROPLANET PRESS NOTICE
FOR EUROPEAN PLANETARY SCIENCE CONGRESS (EPSC) 2014**

Date: 08th of September 2014

A MAP OF ROSETTA'S COMET

The surface of comet 67P/Churyumov-Gerasimenko can be divided into several morphologically different regions. High-resolution images of comet 67P/Churyumov-Gerasimenko reveal a unique, multifaceted world. ESA's Rosetta spacecraft arrived at its destination about a month ago and is currently accompanying the comet as it progresses on its route toward the inner solar system. Scientists have now analyzed images of the comet's surface taken by OSIRIS, Rosetta's scientific imaging system, and allocated several distinct regions, each of which is defined by special morphological characteristics. This analysis provides the basis for a detailed scientific description of 67P's surface and the images have been presented today at the European Planetary Science Congress (EPSC) 2014 at the Centro de Congressos do Estoril, Cascais, Portugal.

"Never before have we seen a cometary surface in such detail", says OSIRIS Principal Investigator Holger Sierks from the Max Planck Institute for Solar System Science (MPS) in Germany. In some of the images, one pixel corresponds to 75 centimeters scale on the nucleus. „It is a historic moment, we have an unprecedented resolution to map a comet“, he adds.

With areas dominated by cliffs, depressions, craters, boulders or even parallel grooves, 67P displays a multitude of different terrains. While some of these areas appear to be quiet, others seem to be shaped by the comet's activity. As OSIRIS images of the comet's coma indicate, the dust that 67P casts into space is emitted there.

"This first map is, of course, only the beginning of our work", says Sierks. "At this point, nobody truly understands, how the morphological variations we are currently witnessing came to be." As both 67P and Rosetta travel closer to the Sun in the next months, the OSIRIS team will monitor the surface looking for changes. While the scientists do not expect the borderlines of the comet's regions to vary dramatically, even subtle transformations of the surface may help to explain, how cometary activity created such a breathtaking world.

Next weekend, on 13 and 14 September 2014, the maps will offer valuable insights as Rosetta's Lander Team and the Rosetta orbiter scientists gather in Toulouse to determine a primary and backup landing site from the earlier preselection of five candidates.

Figure 1: In this view of the “belly” and part of the “head” of comet 67P/Churyumov-Gerasimenko, several morphologically different regions are indicated. Credits: ESA/Rosetta/MPS for OSIRIS Team

Figure 2: Jagged cliffs and prominent boulders: In this image, several of 67P's very different surface structures become visible. The left part of the images shows the side wing of the comet's "body", while the right is the back of its "head". The image was taken by OSIRIS, Rosetta's scientific imaging system, on September 5th, 2014 from a distance of 62 kilometers. One pixel corresponds to 1.1 meters. About Rosetta

Rosetta is an ESA mission with contributions from its member states and NASA. Rosetta's Philae lander is provided by a consortium led by DLR, MPS, CNES and ASI. Rosetta will be the first mission in history to rendezvous with a comet, escort it as it orbits the Sun, and deploy a lander to its surface.

The scientific imaging system OSIRIS was built by a consortium led by the Max Planck Institute for Solar System Research (Germany) in collaboration with CISAS, University of Padova (Italy), the Laboratoire d'Astrophysique de Marseille (France), the Instituto de Astrofísica de Andalucía, CSIC (Spain), the Scientific

Support Office of the European Space Agency (The Netherlands), the Instituto Nacional de Técnica Aeroespacial (Spain), the Universidad Politécnica de Madrid (Spain), the Department of Physics and Astronomy of Uppsala University (Sweden), and the Institute of Computer and Network Engineering of the TU Braunschweig (Germany). OSIRIS was financially supported by the national funding agencies of Germany (DLR), France (CNES), Italy (ASI), Spain (MEC), and Sweden (SNSB) and the ESA Technical Directorate.

About the European Planetary Science Congress (EPSC)

EPSC is the major European meeting on planetary science. EPSC 2014 is taking place at the “Centro de Congressos do Estoril”, Cascais, Portugal, from Sunday 07 to Friday 12 September 2014, with more than 800 scientists participating from Europe and around the world and a programme that includes 52 sessions and workshops, and more than 800 scheduled abstracts for oral presentations and posters sessions. Details of the Congress and a full schedule of scientific sessions and events can be found at the official website: <http://www.epsc2014.eu/> EPSC 2014 is organised by Europlanet and Copernicus Meetings. Follow #epsc2014 @epsc2014 @europlanetmedia on Twitter

About Europlanet

Europlanet is a network of planetary scientists, whose aim is to bring together the disparate European community so that Europe can play a leading role in space exploration. Europlanet’s activities complement the mission activities of the European Space Agency through field work at planetary-analogue terrains on Earth, laboratory measurements, computer modelling and observations from ground-based telescopes. Founded in 2002 and funded by the European Commission from 2005-2012, Europlanet has evolved into a community-based organisation that will carry on this work and plan for future missions and mission support. www.europlanet-eu.org
